Coronary angiography is currently the reference standard for the diagnosis of CAD, but has many limitations that are widely recognized. In recent years, a number of imaging techniques have been developed to allow for noninvasive imaging of the coronary arteries and myocardium. In most of these technologies, images of the heart and coronary arteries are constructed by identification and tagging of myocardial anatomy using various imaging modalities. These images, however, are still significantly limited in their diagnostic capabilities. As an example, a computed tomography (CT) imaging technology is capable of imaging coronary arteries directly, but diagnostic tools with this technology are not widely available or in use. An ultrasound imaging system has the advantage of being widely available; however, its ability to clearly visualize the coronary arteries is inherently limited. Magnetic resonance imaging (MRI) scanners are capable of performing high-resolution 3D volumetric imaging, and many have been developed to image the heart and coronary arteries. However, current MRI techniques are expensive and technically challenging, particularly for imaging the heart, since the blood is an inherently strong magnetic material. In addition, MRI is inherently a closed system; a patient needs to be located and confined in the MRI system, and cannot undergo other necessary diagnostic and surgical procedures while inside the MRI system. Finally, the MR image data are inherently large and hard to analyze.THE FLATS – Atlanta Falcons quarterback Matt Ryan knows the next five months could be very stressful for him and the team. After the Falcons (2-2) host the San Francisco 49ers (3-1) on Sunday at 1 p.m. CT, they'll have one week to prepare for a tough stretch of games over the next four-five weeks. "This next week, we'll take a lot of pride in not only winning this game but c6a93da74d
